

Enhancing User Retention

VoltShift - Product Strategy & Agile Requirements

The 30-Day Churn Problem

- BigQuery cohort analysis reveals a severe **80% user drop-off** after the first 30 days.
- The highest churn velocity is heavily localized within the **Free Tier** user segment.
- This drop-off correlates directly to an ongoing loss in potential Monthly Recurring Revenue (MRR).
- **Our Hypothesis:** Earning rewards currently takes too long, breaking the engagement loop before habits form.

Cohort Retention & Profitability

Age Group	Gender Segments	Target Tier	Current 30-Day Retention
18 - 24	Female / Male	Free	18%
25 - 34	Female / Non-Binary	Premium	42% (Highest LTV)
25 - 34	Male	Basic	26%
35 - 44	All	Free	15%

Feature Prioritization Matrix

1. The Streak Bonus (High Priority)

Benefit: High impact on 30-day retention for Free users.

Effort: Medium engineering effort. Core logic relies on simple timestamps and push notification triggers.

Decision: Immediate Agile Sprint allocation. High ROI potential.

2. Carbon Offset Marketplace (Low Priority)

Benefit: High potential for PR and premium brand positioning.

Effort: Extremely high effort. Requires third-party financial API integrations and complex legal compliance.

Decision: Backlogged for Q4. Too resource-heavy for current retention goals.

Streak Bonus Feature ROI

275%

Projected Return on Investment

Yielding a net positive return far exceeding the cost of GreenPoint rewards.

\$1.2k

Net Profit per 750 Cohort

Calculated via increased LTV of retained users minus intervention costs.

Agile User Stories

1. The Streak Tracker

As a Free-tier user,
I want to see a visual tracker of my consecutive logged trips,
So that I know how close I am to earning my 7-day bonus reward.

Acceptance Criteria:

- Increments by +1 for consecutive days.
- Resets to 1 if a calendar day is missed.
- Credits 500 bonus GreenPoints on day 7.

2. The Push Notification

As a Marketing Manager,
I want users to receive a push notification on day 6 of their streak,
So that we can reduce the number of users who forget to log their final trip.

Acceptance Criteria:

- Trigger check occurs at 4:00 PM local time.
- Validates if current streak is exactly 6.
- Prevents send if trip is already logged today.

System Architecture & Logic

System Architecture & Edge Case Logic

Mapping the '7-Day Streak' Decision Tree

Bullet Points (Left Side):

- **Preventing Exploit:** Logic requires a daily check to ensure users cannot log multiple fake trips in a single day to farm GreenPoints.
- **Seamless Resets:** Automated logic to gracefully reset the streak to 1 if a calendar day is missed, preventing manual database errors.
- **Reward Automation:** System automatically triggers the 500 GreenPoint API credit the moment the 7th consecutive trip is verified, eliminating manual customer service requests.

Quality Assurance UAT

Headline: User Acceptance Testing (UAT) Plan

Test ID	Scenario	Steps to Execute	Expected Result
TC-01	Standard increment	Log trip Mon/ Log Trip Tues.	Streak counter updates to "2"
TC-02	Same-day duplicate	Logtrip at 9 AM / Log trip at 2 PM.	Streak counter remains at ""1"
TC-03	Broken streak	Log trip Mon. / Skip Tues. / Log Wed.	Streak counter resets to "1"

Implementation & QA Strategy

Wireframing

Map the UX flow for the tracker animation and reward unlock screen in Figma to align with VoltShift design systems.

Sprint

Engineering sprint estimation.

UAT Matrix

Execute User Acceptance Testing to verify same-day multi-trips, broken streak reset behaviors, and point distribution.
